                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligorar primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; primer; detection; diagnosis; antisense therapy; gene therapy.
                                                 This is the amino acid sequence of peptide E19V, comprising amino acid residues E340-V364 of human GP88 (see AAW85475). GP88 is an EAB alycoprotein autocrine growth factor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. E19V was used to raise neutralising antibodies to GP88. Antagonists to GP88, such as anti-GP88 antibodies, are used to treat diseases associated with increased expression of GP88, particularly cancer but also viral infections. Anti-GP88

oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide comprises a 3'-end sequence, where the polynucleotide which comprises a 3'-end sequence, where the polynucleotide comprises a 1'-end sequence, where the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense#therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length coMAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length coMAs. The primers allow obtaining of the full-length compass. The primers allow obtaining of the full-length compassing the primers allow obtaining and the full-length compassing the primers allow obtaining of the full-length compassing the primers allow obtaining and the full-length compassing the primers allow obtaining and the full-length compassing the primers allow obtaining and the full-length compassing the primers allow obtaining allow the full-length compassing the full-length compassi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonuclectides, all of which are used in the exemplification of the present investion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Composition containing antagonist of growth factor GPB8 - useful for treating cancer and viral diseases and also for diagnosing disease from altered GPB8 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of human GP88, an 88 kDa glycoprotein autocrine growth factor and epithilin/granulin precursor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. Inhibition of GP88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GP88; granulin; epithilin; human; growth factor; autocrine; tumour; cancer; viral infection; antagonist; therapy; dlagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression or action in the tumorigenic cells results in an inhibition of the tumorigenic properties of the overproducing cells. Antagonists to GPBB are used to treat diseases associated with increased expression of GPBB, particularly cancer but also viral infections. Fragments of GPBB are used to raise specific
                                                                                 The granulin inhibits keratinocytes and is useful in formulations for promoting the healing of wounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                         ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bloactivity. In contrast, however, ET-2 is apparently not capable of eallotling the growth stimulatory activity characteristic of ET-1 and, in fact, antagonises this ET-1 activity. The method comprises obtaining a biological sample containing cells from the patient, detecting 688 in the cells of the sample, and determining the number of GP88 positive cells in the sample, and determining the ratio of GP88 positive cells to the total number of cells in the sample. The invention also relates to a method for determining if a human patient is resistant to the antineoplastic effects of antioestrogen therapy. The method is useful for diagnosing tumourigenicity in a sample, such as blood, serum, plasma, urine, nipple aspirate, cerebrospinal fluid, liver, kidney, breast, bone, brain, lung, colon, or skin cancer. The method can be used to treat or prevent re-occurrence of cancer in a patient, by administering tamoxifen if the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           granulin precursor; GP88; cytostatic; tumoùrigenicity; tamoxifen; pplastic; antioestrogen therapy; skin cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antinflammatory; antithyroid; antiallergic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and dispossing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating
sample contains less than 10 % GP08, or less than 5 % GP08 positive cells. The present sequence is human granulin/epithelin precursor (GP08)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the

The epithelins appear to comprise several distinct members sharing significant structural homology. Two members of the epithelin family, BP-1 and EP-2, have been purified from natural sources, and cDNAs encoding these and several other members of the epithelin family have been isolated from rat (AAQ14338), human (AAQ14339), bovine, murine (AAQ14340) and chicken (AAQ14353).
ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitors bloactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and,
                                                                                                           ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bioactivity. In contrast, whover, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and, in fact, antagonises this ET-1 activity. cells. Murine GP88 cDNA (see AAV82824) was obtained from the highly tumorigenic PC cell line. Antagonists to GP88 are used to treat diseases associated with increased expression of GP88, particularly cancer but also viral infections. Fragments of GP88 are used to raise specific antibodies (used as antagonists, as diagnostic reagents and for delivering toxins or other compounds to GP88 expressing cells) and to screen for antibodies. Methods are provided for diagnosing disease, or determining susceptibility to disease, resulting from altered GP88 activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of murine GPBB, an 88 kDa glycoprotein autocrine growth factor and epithilin/granulin precursor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. Inhibition of GPBB expression or action in the tumorigenic cells results in an inhibition of the tumorigenic properties of the overproducing
                                                                                                                                                                                                                                                                                                                                                                                                          GP88; granulin; epithilin; mouse; growth factor; autocrine; tumour; cancer; viral infection; antagonist; therapy; diagnosis.
                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oilgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for estore normal activity of (II) or to treat diseases states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical
cells from the patient, detecting GP88 in the cells of the sample, and determining the number of GP88 positive cells in the sample, and determining the ratio of GP88 positive cells to the total number of cells in the sample. The invention also relates to a method for determining if a human patient is resistant to the antineoplastic effects of anticestrogen therapy. The method is useful for diagnosing tumourigenicity in a sample, such as blood, serum, plasma, urine, nipple aspirate, cerebrospinal fluid, liver, kidney, breast, bone, brain, lung, colon, or skin cancer. The method can be used to treat or prevent re-occurrence of cancer in a patient, by administering tamoxifen if the sample contains less than 10 % GP88, or less than 5 % GP88 positive cells. The present sequence is mouse granulin/epithelin precursor (GP88)
                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of chromosome mapping; gene mapping; gene therapy; forensic; supplement; medical imaging; diagnostic; genetic disorder.

Where a primer set comprises: (a) an oligo-dT primer and an oligoundistotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide comprising a sequence complementary to a
disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and aliagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Whote: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

         the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length AAH13613 to AAH13612 represent human cDNA sequences; AAB92446 to AAH13632 represent buman anino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
 oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Wang D;

The invention relates to human nucleic acids (AAI57798-AAI61369) and

```
ö
        immunosuppressant and cytostatic activity. The polymoclectides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the juvention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous alorables, peripheral nervous and placelised neuropathis and central nervous system disease, such as Alzheimer's, parkinson's disease, Huntington's disease, ampotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses inclide the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
                                                                                                                                                                                                              The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an Oilgo-dr primer and an oilgonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detection; diagnosis; antisense therapy; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                    a
```

complementary strand of a polynucleotide which comprises a 5-end sequence and an oligonucleotide which comprises a 5-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence complementary to a oligonucleotide comprises at 15 nucleotides and the complementary to a the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length conva. The primers are useful for synthesising polynucleotides, the full-length convas. The primers allow obtaining of the full-length convas. The primers allow obtaining of the full-length convas as ally without any specialised methods. AAR03166 to AAR13628 and AAR13639 represent human amino acid sequences; and AAR13629 to AAR13632 represent oligonucleotides, all of which are used in the exemplification of an oligonucleotide comprising a sequence complementary to the of the present invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FUNCTION: GRANULINS HAVE POSSIBLE CYTOKINE-LIKE ACTIVITY. THEY MAY PLAY A ROLE IN INFLAMMATION, WOUND REPAIR, AND TISSIE REMODELING. FUNCTION: GRANULIN A PROMOTES PROLIFERATION OF THE EPITHELIAL CELL. LINE A431 IN CUTFORE WHILE GRANULIN B ACTS AS AN ANTAGONIST OF GRANULIN B, INHIBITING THE GROWTH.

ALTERNATIVE PRODUCTS: 2 150forms; 1 (shown here) and 2; may be produced by alternative splicing.

TISSUE SPECIFICITY: IN MYELOGENOUS LEUKENIC CELL LINES OF PROMONOCYTIC, PRONYELCCYTIC, AND PRORYTHELIAL CELL LINES. PRESENT IN INFLAMMATORY CELLS AND BONE MARROW. HIGHEST LEVELS IN KIDNEY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Biophys. Res. Commun. 173:1161-1168(1990).
-!- FUNCTION: GRANULINS HAVE POSSIBLE CYTOKINE-LIKE ACTIVITY. THEY MAY PLAY A ROLE IN INFLAMMATION, WOUND REPAIR, AND TISSUE REMODELING.
-!- TISSUE SPECIFICITY: UBIQUITOUS; MOST ABUNDANT IN THE SPLEEN AND SEVERAL TISSUES OF ENDOCKINE SIGNIFICANCE.
-!- PTM: GRANULINS ARE DISULFIDE BRIDGED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Plowman G.D., Green J.M., Neubauer M.G., Buckley S.D., McDonald V.L., Todaro G.J., Shoyab M.;
